

WEARABLE TRAINEE STRESS MONITOR

INNOVATIVE TACTICAL TRAINING SOLUTIONS

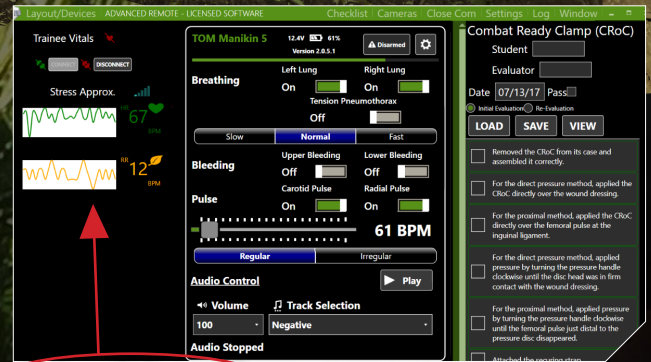

Respond dynamically to your trainee's real-time stress factors

Introducing the most in-depth system for controlling your high-stress and live-fire training exercises, from the company that brought you the industry-leading **TOMManikin™**, now combined with state-of-the-art wearable technology to prepare your trainees to perform under any conditions.

Integrated with our proprietary, all-encompassing **OPMAN™** software, the Zephyr™ biomodule sensor is fitted directly to your trainees, and provides a combination of compactness and comfort. The sensor records and transmits the physiological and biomechanical data that helps you see what's humanly possible.

Further, with the unprecedented access to your trainee's physical condition while operating under pressure, **OPMAN™** gives you the ability to dynamically alter external stress factors all within one program, when paired with our full suite of **Mobile Environmental Control Unit (► ITTS-MECU)** components, the **ITTS Ballistics Simulator (► ITTS-PMG)**, or **ITTS Blast Simulator (► ITTS-PBS)**.

Whether you're monitoring individuals or squads, you can focus on performance improvements, and now with integration with the award-winning suite of realistic, durable, and efficient training equipment from **ITTS**, you can be confident that your team will be at their best when faced with the worst.
